## Visualization 1

Rank all countries in the world according to COVID cases and the percent of cases in each country?

We can get a sense of the scope and severity of the pandemic in various regions of the world by knowing which countries have the highest number of cases.

Understanding which nations may require extra resources, including as medical equipment, manpower, and financing, can help politicians and healthcare professionals respond to the pandemic in an efficient manner.

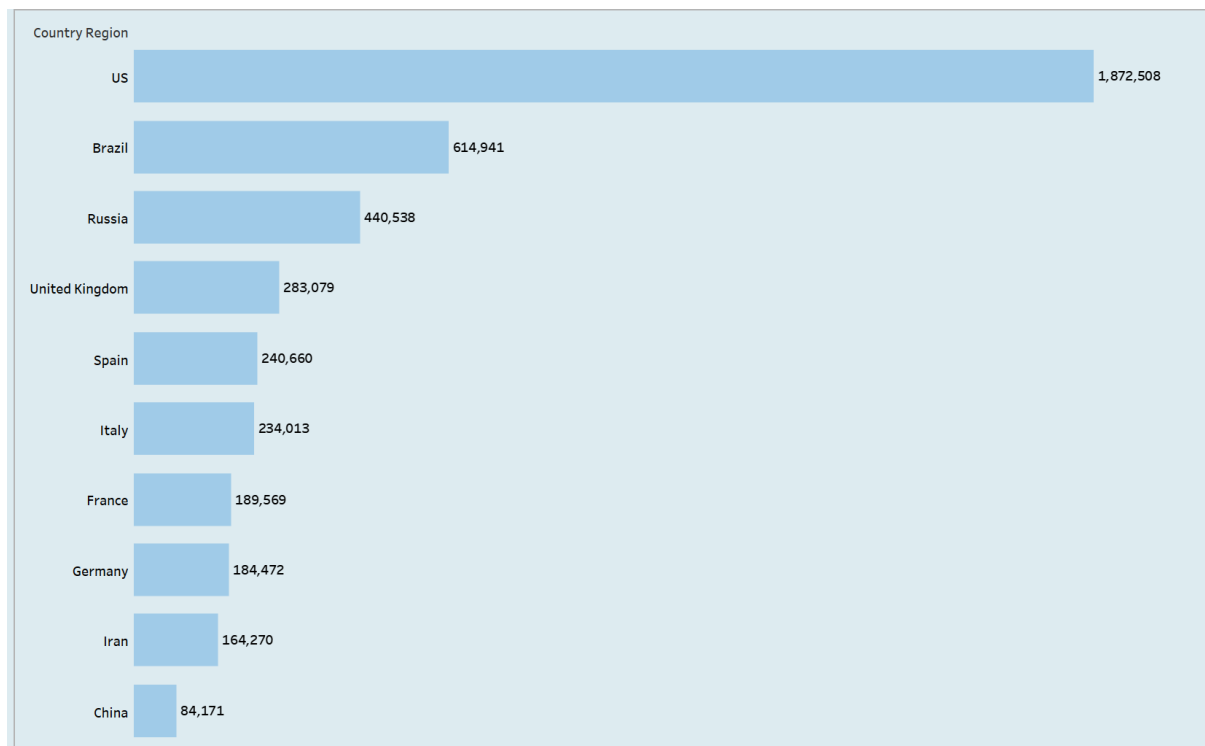

The ranking can encourage international cooperation between nations because those with high case counts can exchange knowledge, assets, and best practices with others to slow the spread of the illness.

The rankings can be used by nations to determine quarantine procedures and travel restrictions for tourists arriving from high-case countries.

Overall, understanding the intensity and effects of the pandemic on a global scale can be improved by decision-makers and the general public using the ranking of nations based on COVID-19 cases.

## Visualization 2

Visualize the top 10 countries with the most COVID-19 cases.

A quick and easy approach to understanding the pandemic's global distribution and effects is to look at the top 10 countries with the most COVID-19 cases.

We can determine which regions of the world are being most badly affected by the virus by looking at which countries have the largest numbers of cases.

We can see how the pandemic is spreading internationally and how it is changing to different areas and countries by charting the top 10 nations over time.

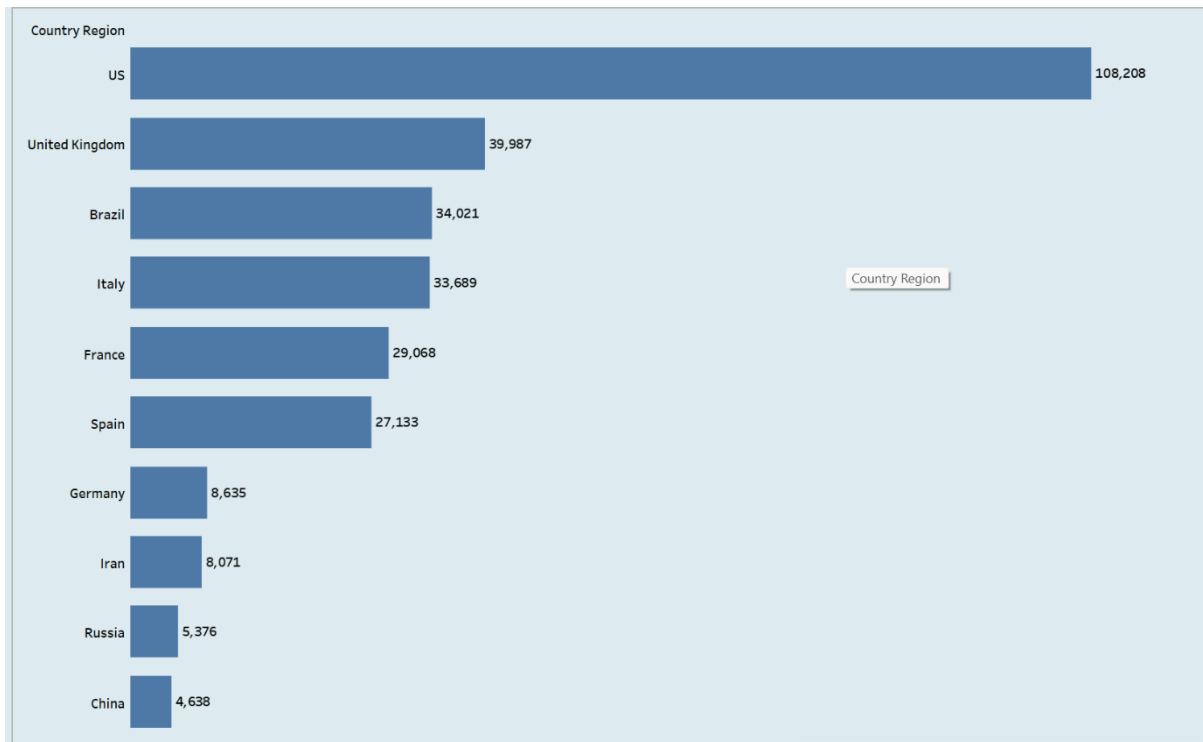

Comparing the number of cases and the response to the epidemic in various nations can help other nations' policies and response plans.

By visually depicting the top 10 countries with the most cases, we may identify areas that may need more attention and resources in order to slow the virus's spread.

Overall, visualizing the top 10 countries with the highest number of COVID-19 cases can help us comprehend the pandemic's effects globally and can help the general public, decision-makers, and healthcare professionals make better choices.

## Visualization 3

Visualize the top 10 countries with the most deaths.

The top 10 countries with the most COVID-19 fatalities can be visualised to provide relevant facts and information for a variety of uses.

By examining which countries have the highest death tolls, we may gain an understanding of how the virus affects people's health and the burden it takes on healthcare systems.

By tracking the top 10 countries over time, we can understand how the epidemic is changing and how it is affecting various regions and nations.

By focusing on the nations with the greatest fatality rates, we can identify areas that require more attention and money. This will guarantee that those who are afflicted receive the care they require while also aiding in the slowing of the virus's spread.

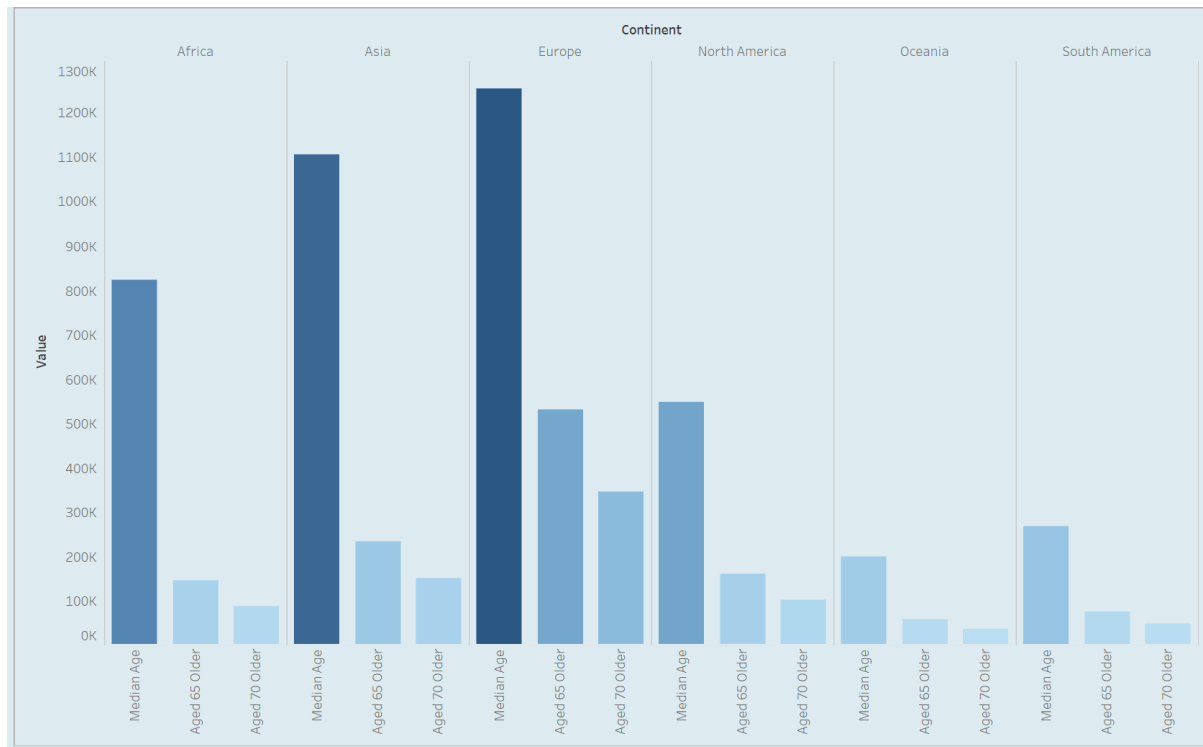

The policies and reaction plans of other countries can benefit from comparisons between the number of fatalities and the response to the epidemic in other countries.

It is possible to raise public awareness of the severity of the pandemic and convince people to take precautions like avoiding close contact with others and wearing masks by displaying the number of fatalities brought on by Covid-19.

Overall, visualising the top 10 nations with the greatest number of COVID-19 fatalities can aid in our understanding of the pandemic's effects on human lives around the world and aid decision-making by public officials, medical personnel, and politicians.

## Visualization 4

Visualize how COVID-19 affects different age categories?

Plotting COVID-19 instances by age group across continents can provide useful statistics and information for a variety of uses.

By visualizing the COVID-19 cases of each age category on each continent, we may ascertain which age groups are most susceptible to the virus. Public health measures like vaccination schemes may be guided by this knowledge.

By graphing the COVID-19 cases of each age category over time, we can evaluate how the pandemic is evolving globally and how it is affecting various age groups on various continents.

By identifying age groups that are most affected, we can pinpoint areas that may need more care and support in order to slow the virus's spread and offer effective care for those who are afflicted.

We can look at how COVID-19 has affected different age groups on other continents in order to better inform policy and response preparations.

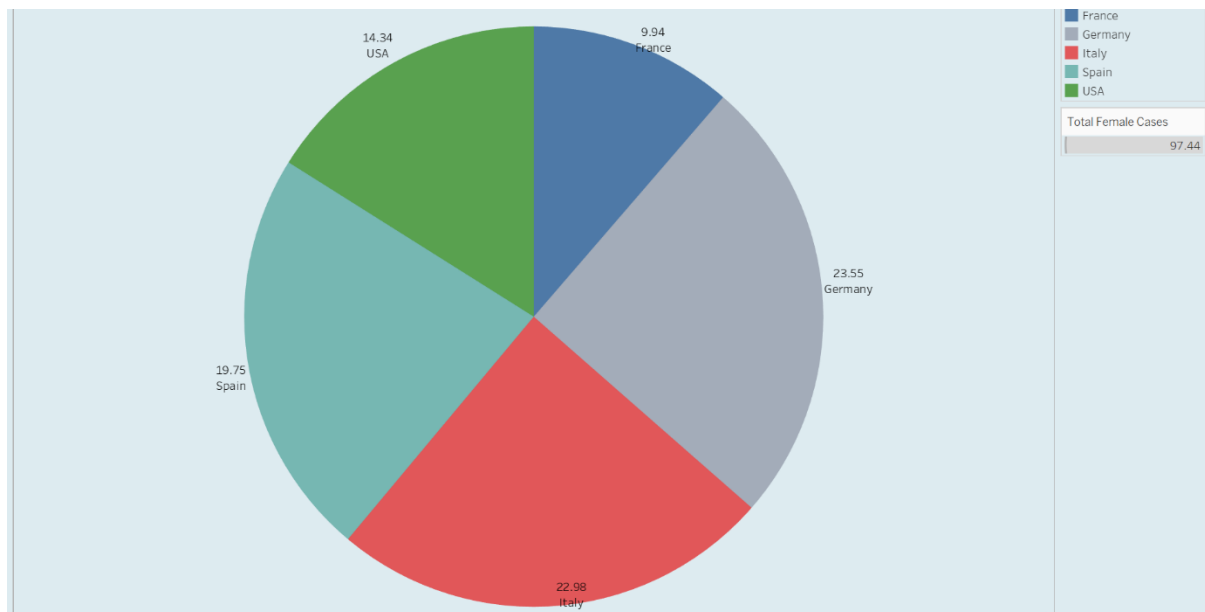

Understanding the severity of the pandemic and being inspired to take precautions like wearing masks and avoiding close contact with others will come from seeing how COVID-19 affects different age groups.

Generally speaking, plotting COVID-19 instances by age category on each continent can help us better understand the pandemic's global effects on different age groups and can be useful to the public, healthcare professionals, and policymakers.

## Visualization 5

Plot a Pie chart that shows the top 5 countries with the most male cases and most female cases.

The top 5 countries with the highest percentage of female COVID-19 cases can be visualized to provide relevant statistics and information for a variety of uses.

By visualizing the top 5 countries with the greatest number of female COVID-19 cases, we can better comprehend the extent to which women are being affected by the virus. To better meet the needs of women during the pandemic, policy and response plans can be guided by this understanding.

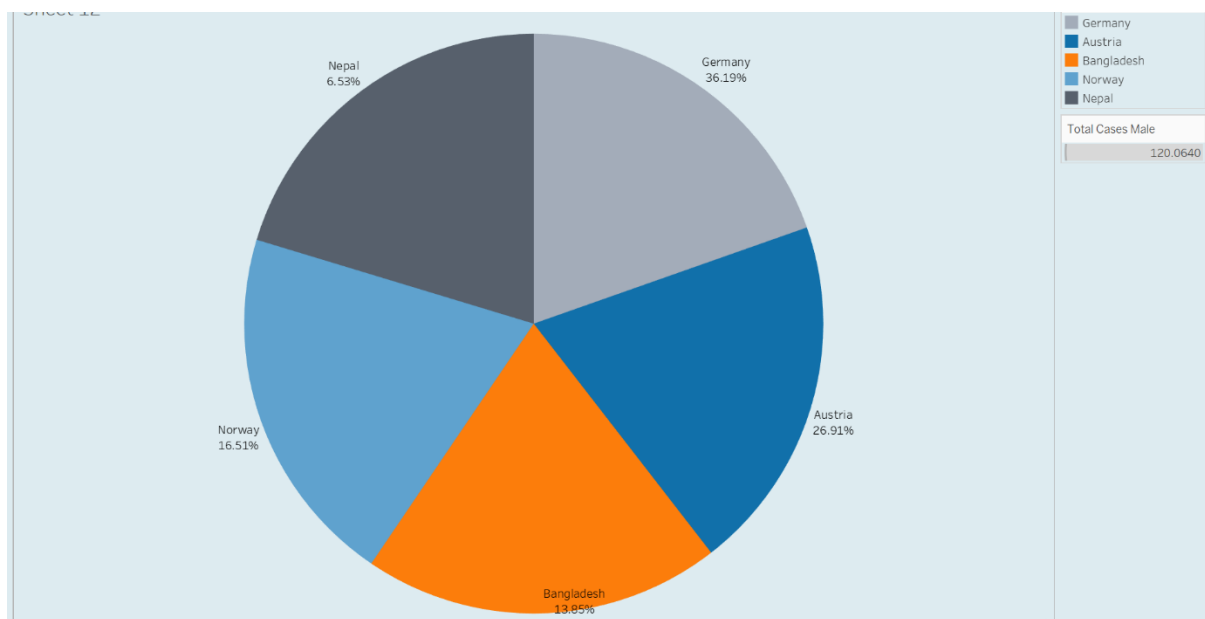

By charting the top 5 countries with the most female COVID-19 infections over time, it is possible to see how the pandemic is evolving internationally and how it is affecting women in different countries.

By concentrating on the countries with the largest proportion of female COVID-19 cases, we can identify areas that may need extra care and funding to help stop the virus's spread and provide adequate treatment for those who are impacted.

To educate policies and strategies for retaliation in other countries, we can compare how COVID-19 impacts women in various countries.

Visualizing the consequences of COVID-19 on women may encourage individuals to take precautionary measures, such as wearing masks and avoiding close contact, especially in locations where women are disproportionately affected by the pandemic.

Overall, a visual representation of the top 5 countries with the highest proportion of female COVID-19 cases can help us better understand how the pandemic is affecting women all over the world and can also assist policymakers, medical experts, and the general public in making decisions that will ensure that women's needs are met during the epidemic.

A multitude of uses can benefit from having a visual representation of the top 5 nations for male COVID-19 cases.

We can better understand the extent to which men are being impacted by the virus by visualizing the top 5 nations with the most male COVID-19 cases. This understanding can guide policies and response efforts to better address the needs of males throughout the pandemic.

We can observe how the pandemic is developing globally and how it is affecting men in various nations by plotting the top 5 countries with the most male COVID-19 cases over time.

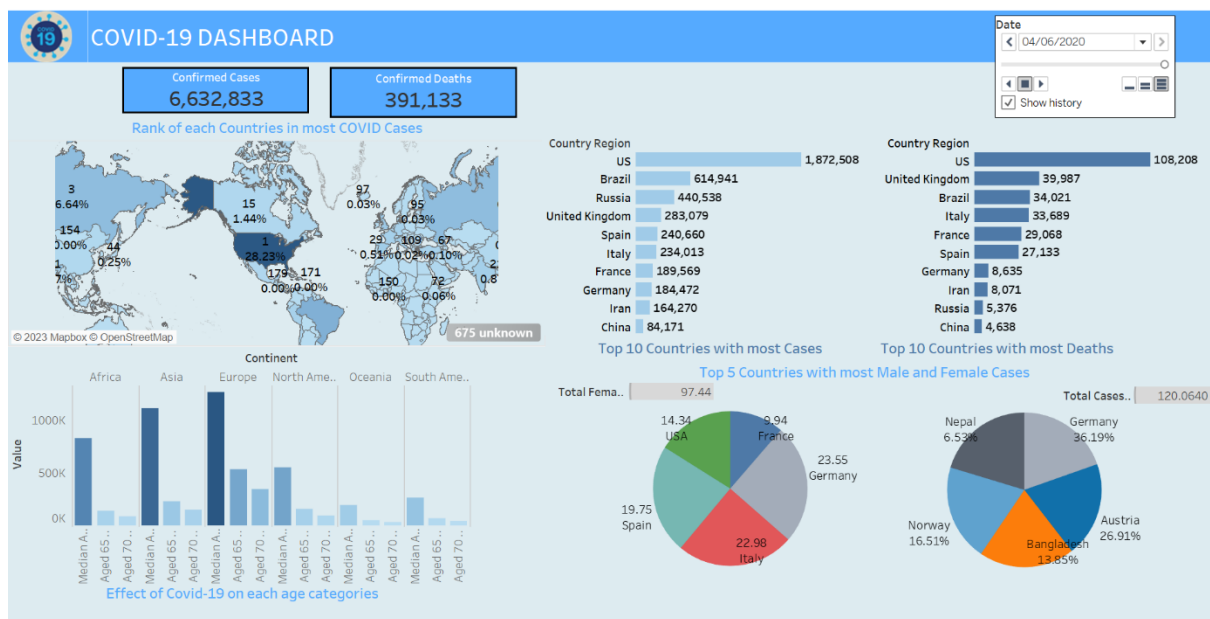

By focusing on the countries with the largest number of male COVID-19 cases, we can spot areas that might need extra care and funding to help stop the virus's spread and provide adequate care for male patients.

We may compare how COVID-19 affects men in different countries, which will be useful for other countries policies and preparedness strategies.

Especially in locations where males are disproportionately affected, illustrating how Covid-19 affects men can raise public awareness of the pandemic's gendered implications and encourage people to take precautionary measures like wearing masks and avoiding close contact.

Overall, visualizing the top 5 nations with the greatest number of male COVID-19 cases can aid in our understanding of the pandemic's effects on males around the world and help governments, medical professionals, and the general public make decisions that will guarantee that men's needs are met during the pandemic.

## FINAL DASHBOARD

This is the final dashboard that I created using the graphs that I’ve made before. I also included the total confirmed cases and total deaths in the whole world.

## Pages

Using a page in feature, you can put together a group of visualizations that show how data changes over time or between different categories. Each page represents a distinct representation of the data based on a specific value or range of values for a given dimension.

An interactive dashboard is created using a page to present data in a fun and engaging way. Pages can show how a certain statistic varies over time or about multiple groups, such as geographical areas or product types.

Here is the link to my dashboard
